NAME	dc desk calculator
SYNOPSIS	dc
DESCRIPTION	<u>dc</u> is an arbitrary precision integer arithmetic package. The overall structure of dc is a stacking (reverse Polish) calculator. The following constructions are recognized by the calculator:
	number The value of the number is pushed on the stack. If the number starts with a zero, it is taken to be octal, otherwise it is decimal.
	<pre>+ - * / % The top two values on the stack are added (±), subtracted (-), multiplied (*), divided (*) or remaindered (%) The two entries are popped off of the stack, the result is pushed on the stack in their place.</pre>
	sx The top of the stack is popped and stored into a register named x, where x may be any character.
	<pre>lx The value in register x is pushed on the stack. The register x is not altered.</pre>
	<u>d</u> The top value on the stack is pushed on the stack. Thus the top value is duplicated.
	p The top value on the stack is printed in decimal. The top value remains unchanged.
	<u>f</u> All values on the stack are popped off and printed in decimal.
	r All values on the stack are popped.
	q exit.
	h print brief synopsis of commands to dc.
	new-line space ignored.
	An example to calculate the monthly, weekly and

hourly rates 10000	for a \$10,000/year salary.
100* (now	in cents)
dsa (non-d	estructive store)
12/	(pennies per month)
1a52/	(pennies per week)
d10*	(deci-pennies per week)
375/	(pennies per hzur)
f	(print all results)
(3) 512	
(2) 1923	0
(1) 8333	3

NAME	dsw delete interactively
SYNOPSIS	dsw [directory]
DESCRIPTION	For each file in the given directory ("." if not specified) $\frac{dsw}{rx}$ types its name. If y is typed, the file is deleted; if "x", dsw exits; if anything else, the file is not removed.
FILES SEE ALSO	rm
DIAGNOSTICS	<i>"?"</i>
BUGS	The name dsw is a carryover from the ancient past. Its etymology is amusing but the name is nonetheless ill- advised.
OWNER	dmr, ken

NAME dtf -- DECtape format

SYNOPSIS /etc/dtf

DESCRIPTION <u>dtf</u> will write timing tracks, mark tracks and block numbers on a virgin DECtape. The format is DEC standard of 578 blocks of 256 words each. The end zones are a little longer than standard DEC.

> Before use, the tape to be formatted should be mounted on drive 0. The 'wall' and 'wtm' switches should be enabled. After the tape is formatted, the switches should be disabled to prevent damage to subsequent tapes due to a controller logic error.

FILES

SEE ALSO sdate

DIAGNOSTICS "?" is typed for any error detected.

BUGS This program does physical I/O on drive 0. The processor priority is set very high due to very stringent real time requirements. This means that <u>all</u> time sharing activities are suspended during the formatting (about 1.5 minutes) The real time clock will also be slow.

OWNER ken

NAME du -- summarize disk usage

SYNOPSIS du [-s] [-a] [name...]

/

dmr

DESCRIPTION <u>du</u> gives the number of blocks contained in all files and (recursively) directories within each specified directory or file name. If name is missing, "." is used.

The optional argument $-\underline{s}$ causes only the grand total to be given. The optional argument $-\underline{a}$ causes an entry to be generated for each file. Absence of either causes an entry to be generated for each directory only.

A file which has two links to it is only counted once.

FILES

SEE ALSO

DIAGNOSTICS

BUGS

Files at the top level (not under -a option) are not listed.

Removable file systems do not work correctly since inumbers may be repeated while the corresponding files are distinct. Du should maintain an i-number list per root directory encountered.

OWNER

NAME ed -- editor

SYNOPSIS ed [name]

DESCRIPTION ed is the standard text editor. ed is based on QED [reference] but is fully if succinctly described here. Differences between ed and QED are also noted to simplify the transition to the less powerful editor.

> If the optional argument is given, simulates an \underline{e} command on the named file; that is to say, the file is read into ed's buffer so that it can be edited.

ed operates on a copy of any file it is editing; changes made in the copy have no effect on the file until an explicit write (w) command is given. The copy of the text being edited resides in a temporary file called the <u>buffer</u>. There is only one buffer.

Commands to <u>ed</u> have a simple and regular structure: zero or more <u>addresses</u> followed by a single character <u>command</u>, possibly followed by parameters to the command. These addresses specify one or more lines in the buffer. Every command which requires addresses has default addresses, so that the addresses can often be omitted.

In general only one command may appear on a line. Certain commands allow the input of text. This text is placed in the appropriate place in the buffer. While ed is accepting text, it is said to be in <u>input</u> mode. In this mode, no commands are recognized; all input is merely collected. Input mode is left by typing a period (.) alone at the beginning of a line.

ed supports a limited form of regular expression notation. A regular expression is an expression which specifies a set of strings of characters. A member of this set of strings is said to be matched by the regular expression. The regular expressions allowed by are constructed as follows:

- An ordinary character (not one of those discussed below) is a regular expression and matches that character.
- A circumflex (^{*}) at the beginning of a regular expression matches the null character at the beginning of a line.

- 3. A currency symbol (\$) at the end of a regular expression matches the null character at the end of a line.
- 4. A period (.) matches any character but a new-line character.
- A regular expression followed by an asterisk (*) matches any number of adjacent occurrences (including zero) of the regular expression it follows.
- 6. A string of characters enclosed in square brackets ([]) matches any character in the string but no others. If, however, the first character of the string is a circumflex (^{*}) the regular expression matches any character but new-line and the characters in the string.
- 7. The concatenation of regular expressions is a regular expression which matches the concatenation of the strings matched by the components of the regular expression.
- The null regular expression standing alone is equivalent to the last regular expression encountered.

Regular expressions are used in addresses to specify lines and in one command (s, see below) to specify a portion of a line which is to be replaced.

If it is desired to use one of the regular expression metacharacters as an ordinary character, that character may be preceded by "\". This also applies to the character bounding the regular expression (often "/") and to \ itself.

Addresses are constructed as follows. To understand addressing in \underline{ed} it is necessary to know that at any time there is a current line. Generally speaking, the current line is the last line affected by a command; however, the exact effect on the current line by each command is discussed under the description of the command.

- 1. The character "." addresses the current line.
- The character "\$" addresses the last line of the buffer.
- 3. A decimal number \underline{n} addresses the nth line of the buffer.

- 4. A regular expression enclosed in slashes "/" addresses the first line found by searching toward the end of the buffer and stopping at the first line containing a string matching the regular expression. If necessary the search wraps around to the beginning of the buffer.
- 5. A regular expression enclosed in queries "?" addresses the first line found by searching toward the beginning of the buffer and stopping at the first line found containing a string matching the regular expression. If necessary the search wraps around to the end of the buffer.
- 6. An address followed by a plus sign "+" or a minus sign "-" followed by a decimal number specifies that address plus (resp. minus) the indicated number of lines. The plus sign may be omitted.

Commands may require zero, one, or two addresses. Commands which require no addresses regard the presence of an address as an error. Commands which require the presence of one address all assume a default address (often ".") but if given more than one address ignore any extras and use the last given. Commands which require two addresses have defaults in the case of zero or one address but use the last two if more than two are given.

Addresses are separated from each other typically by a comma (,). They may also be separated by a semicolon ";". In this case the current line is set to the the previous address before the next address is interpreted. This feature is used to control the starting line for forward and backward searches ("/", "?").

In the following list of <u>ed</u> commands, the default addresses are shown in parentheses. The parentheses are not part of the address, but are used to show that the given addresses are the default.

As mentioned, it is generally illegal for more than one command to appear on a line. However, any command may be suffixed by "p" (for "print). In that case, the current line is printed after the command is complete.

In any two-address command, it is illegal for the

first address to lie after the second address.
 (.)a
 <text>

text>

The append command reads the given text and appends it after the addressed line "." is left on the last line input, if there were any, otherwise at the addressed line. Address "0" is legal for this command; text is placed at the beginning of the buffer. (NOTE: the default address differs from that of QED.)

> (.,.c) (text> .

The change command deletes the addressed lines, then accepts input text which replaces these lines. "." is left at the last line input; if there were none, it is left at the first line not changed.

(.,.)d The delete command deletes the addressed lines from the buffer. "." is left at the first line not deleted.

e filename The edit command causes the entire contents of the buffer to be deleted. and then the named file to be read in. "." is set to the last line of the buffer. The number of characters read is typed.

(1 ,s)g/regular expression/command

In the global command, the first step is to mark every line which matches the given regular expression. Then for every such line, the given command is executed with "." set to that line. The repeated command cannot be a, g, i, or c.

> (.)i <text> .

This command inserts given text before the addressed line. "." is left at the last line input; if there were none, at the addressed line. This command differs from the <u>a</u> command only in the placement of the text.

(.,.)1 The list command prints the addressed lines in an unambiguous way. Non-printing

characters are over-struck as follows: char prints bs [overstruct - \] tab [overstruct - >] [overstruct - <] ret [overstruct I -] SI SO [overstruct 0 -] All characters preceded by a prefix (ESC) character are printed over-struck with without the prefix. Long lines are folded with the sequence \newline. (.,.p) The print command prints the addressed lines. . is left at the last line printed q The quit command causes ed to exit. No automatic write of a file is done. (\$)r filename The read command reads in the given file after the addressed line. If no file name is given, the file last mentioned in e, r, or w commands is read. Address "0" is legal for r and causes the file to be read at the beginning of the buffer. If the read is successful, the number of characters read is typed."." is left at the last line of the file. (.,.)s/regular expression/replacement/ The substitute command searches each addressed line for an occurence of the specified regular expression. On each line in which a match is found, the first (and only first, compare QED) matched string is replaced by the replacement specified. It is an error for the substitution to fail on all addressed lines. Any character other than space or new-line may be used instead of "/" to delimit the regular expression and the replacement. "." is left at the last line substituted.

The ampersand "&" appearing in the replacement is replaced by the regular expression that was matched. The special meaning of "&" in this context may be suppressed by preceding it by "\".

(1,\$)w filename

The write command writes the addressed lines onto the given file. If no file name is given, the file last named in e, r, or \underline{w} commands is written. "." is unchanged. If the command is successful, the number of characters written is typed. The line number of the addressed line is typed. . is unchanged by this command.

(\$)=

The line number of the addressed line is typed. "." is unchanged by this command.

!UNIX command

The remainder of the line after the "!" is sent to UNIX to be interpreted as a command. "."is unchanged.

(newline>
A blank line alone is equivalent to ".+lp";
it is useful for stepping through text.

 \underline{Ed} can edit at most 1500 lines and the maximum size of a line is 256 characters, The differences between \underline{ed} and QED are:

- There is no \f character; input mode is left by typing . alone on a line.
- 2. There is only one buffer and hence no stream directive.
- 3. The commands are limited to:

acdegilpqrsw=!

where e is new.

4. The only special characters in regular expressions are: * ^ \$ [.

which have the usual meanings. However, "^" and "\$" are only effective if they are the first or last character respectively of the regular expression. Otherwise suppression of special meaning is done by preceding the character by "\ , which is not otherwise special.

- In the substitute command, only the leftmost occurrence of the matched regular expression is substituted.
- 7. The a command has a different default address.
- FILES /tmp/etma, etmb, ... temporary
 /etc/msh is used to implement the "!" command.

BUGS	The following is a list of those features not yet implemented: functions, arithmetic statement functions. data statements, complex constants, hollerith constants, continuation cards		
OWNER	dmr, ken		

NAME form -- form letter generator

SYNOPSIS form proto arg1 ...

DESCRIPTION form generates a form letter from a prototype letter, an associative memory, arguments and in a special case, the current date.

If form is invoked with the argument x, the following files come into play:

x.f prototype input x.r form letter output x.am associative memory form.am associative memory if x.am not found.

Basically, form is a copy process from the file x.f to the file x.r. If an element of the -form n (where <u>n</u> is a digit from 1 to 9) is encountered, The nth argument is inserted in its place, and that argument is then rescanned. If 0 is encountered, the current date is inserted. If the desired argument has not been given, a message of the form "n:" is typed. The response typed in then is used for that argument.

If an element of the form [name] is encountered, the name is looked up in the associative memory. If it is found, the contents of the memory under this name replaces the original element (again rescanned.) If the name is not found, a message of the form "name: " is typed. The response typed in is used for that element. If the associative memory is writable, the response is entered in the memory under the name. Thus the next search for that name will succeed without interaction.

In both of the above cases, the response is typed in by entering arbitrary text terminated by two new lines. Only the first of the two new lines is passed with the text. The process is instantly terminated if an end of file is encountered anywhere except in the associative memory.

FILES	x.f	input file

NAME	lbppt load binary paper tapes
SYNOPSIS	lbppt output [input]
DESCRIPTION	<pre>lbppt loads a paper tape in standard UNIX binary paper tape format. It is used to bring files to a UNIX installation. Currently there is a GECOS program to prepare a GECOS file in binary paper tape format. If the input file is specified, the character stream from that input is expected to be in UNIX binary paper tape format. If it is not present, /dev/ppt is assumed. The input stream is interpreted, checksummed, and copied to the</pre>
	output file.
FILES	/dev/ppt
SEE ALSO	dbppt, bppt format
DIAGNOSTICS	"checksum"; "usage:"; "read error".
BUGS	
OWNER	ken

NAME	ld link editor
SYNOPSIS	<u>ld</u> [-usaol] name1]
DESCRIPTION	<u>ld</u> combines several object programs into one; resolves external references; and searches libraries. In the simplest case the names of several object programs are given, and <u>ld</u> combines them, producing an object module which can be either executed or become the input for a further <u>ld</u> run.
	The argument routines are concatenated in the order specified. The entry point of the output is the beginning of the first routine.
	If any argument is a library, it is searched, and only those routines defining an unresolved external reference are loaded. If any routine loaded from a library refers to an undefined symbol which does not become defined by the end of the library, the library is searched again. Thus the order of libraries primarily affects the efficiency of loading, not what routines get loaded.
	\underline{ld} understands several flag arguments which are written preceded by a "-"
	-s "squash" the output, that is, remove the symbol table and relocation bits to save space (but impair the usefulness of the debugger). This information can also be removed by <u>strip</u> .
	-u take the following argument as a symbol and enter it as undefined in the symbol table. This is useful for loading wholly from a library, since initially the symbol table is empty and an unresolved reference is needed to force the loading of the first routine.
	-o set the origin of the load to the octal number which is given as the next argument. This option affects only the definition of relocatable external symbols. See DMR before using.
	-l This option is an abbreviation for a library name. "-l" alone stands for "/etc/liba.a", which is the standard system library for assembly language programs. "-lx" stands for /etc/libx.a where x is any character. There are libraries for Fortran (x="f") and B (x="b").

	<pre>-a means absolute" (load at origin absolute 0) but it doesn't work.</pre>
	The output of <u>ld</u> is left on <u>a.out</u> . This file is executable only if no errors occurred during the load.
FILES	/etc/libx.a, for various x; /etc/ltma, ltmb, (temporary) a.out (output file)
SEE ALSO	as, strip, ar (maintains libraries)
DIAGNOSTICS	"can't create temp file"— unwritable directory or someone else is using <u>ld</u> in the same directory.
	"can't open temp file" maybe someone has deleted it out from under you.
	"file not found" bad argument
	"bad format" bad argument
	"relocation error" bad argument (relocation bits corrupted)
	"bad relocation" user error: a relocatable reference to an external symbol that turns out to be absolute.
	"multiply defined" same symbol defined twice in same load
	"un" stands for undefined symbol
	"symbol not found" — loader bug
BUGS	Option "-a" doesn't work at all; option "-o" doesn't work right.
OWNER	dmr

NAME	ln make a link
SYNOPSIS	<u>ln</u> name1[name2]
DESCRIPTION	<u>ln</u> creates a link to an existing file name1. If name2 is given, the link has that name; otherwise it is placed in the current directory and its name is the last component of name1.
	It is forbidden to link to a directory or to link across file systems.
FILES	
SEE ALSO	rm, to unlink
DIAGNOSTICS	"?"
BUGS	There is nothing particularly wrong with ln, but links don't work right with respect to the backup system: one copy is backed up for each link, and (more serious) in case of a file system reload both copies are restored and the information that a link was involved is lost.
OWNER	ken, dmr

NAME	ls list contents of directory
SYNOPSIS	<u>ls</u> [-ltasd] name1
DESCRIPTION	ls lists the contents of one or more directories under control of several options:
	1 list in long format, giving i-number, mode, owner, size in bytes, and time of last modification for each file. (see stat for format of the mode)
	t sort by time modified (latest first) instead of by name, as is normal
	a list all entries; usually those beginning with "." are suppressed
	s give size in blocks for each entry
	<pre>d if argument is a directory, list only its name, not its contents (mostly used with -l to get status on directory)</pre>
	If no argument is given, "." is listed. If an argument is not a directory, its name is given.
FILES	/etc/uids to get user ID's for ls -l
SEE ALSO	stat
DIAGNOSTICS	"name nonexistent"; "name unreadable"; "name unstatable".
BUGS	In ls -1, when a user cannot be found in /etc/uids, the user number printed instead of a name is incorrect. It is correct in stat.
OWNER	dmr, ken

NAME	mail send mail to another user
SYNOPSIS	mail [letter person]
DESCRIPTION	<u>mail</u> without an argument searches for a file called <u>mailbox</u> , prints it if present, asks if it should be saved. If the answer is y, the mail is renamed mail, otherwise it is deleted. The answer to the above question may be supplied in the <u>letter</u> argument.
	When followed by the names of a letter and one or more people, the letter is appended to each person's <u>mailbox</u> . Each letter is preceded by the sender's name and a postmark.
	A <u>person</u> is either the name of an entry in the directory /usr, in which case the mail is sent to /usr/person/mailbox, or the path name of a directory, in which case <u>mailbox</u> in that directory is used.
	When a user logs in he is informed of the presence of mail.
FILES	<pre>/etc/uids to map the sender's numerical user ID to name; mail and <u>mailbox</u> in various directories.</pre>
SEE ALSO	init
